

## **SOLAR NOW UP AND RUNNING**

At last! The final meter installation has finally been installed, and our solar system is up and running; its churning out some serious kilovolts (see the on-line productivity graph below for the past week). Shown are days horizontally, and kilovolt production vertically. Output is related to amount of sunlight, and for this week ranges from 40 to 20 kilovolts per day. For comparison, our smaller home system generates an average of 3-6 kilovolts per day. We will keep you posted as our success grows.
